MPSA 2026 - estimation results for paper

Sofía Granados and Linette Page

2026-04-19

1. Set up

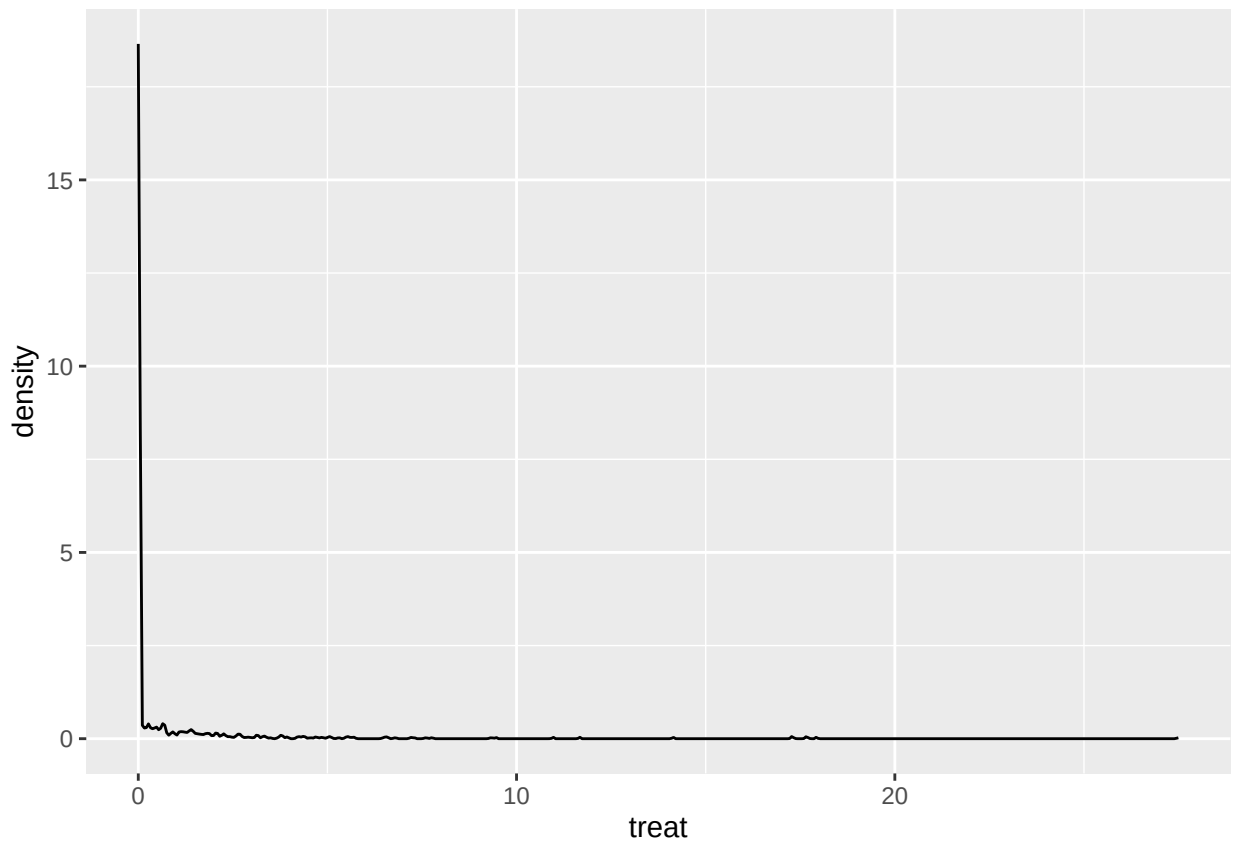
2. Data cleaning

Treatment is disappearances and homicides by the state; calculated as the yearly rate by 10,000

2.1 choosing treatment and covariates

2.2 Covariates

A density plot of the yearly rate of cases per 10,000 per municipality; followed by the exact number and proportion of control municipalities



```
##    0
## 746
```

```
## [1] 0.7415507
```

2.2.1 Covariate balance

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.408	0.457	0.000	0.000
log_pop	10.192	9.355	0.000	0.000
gdp_pcap_cons2005	5.601	6.162	0.025	0.381
gini	0.449	0.458	0.001	0.000
etv_state_pre	3.611	1.897	0.000	0.000
etv_guerr_pre	50.457	22.301	0.000	0.000
hist_land_conflict	0.108	0.034	0.000	NA
justice_percent	0.076	0.072	0.722	0.002
rank_w_any	0.089	0.043	0.017	0.000

3 Versions of matching and weighting

3.1 Naive regression

3.2 Naive + Control regression

3.3 Matching - covariates

Throws away non-matched control units

- No replacement and one-to-one matching

- with Match(): closest X_i through normalized Euclidean distance
- BiasAdjust = TRUE: bias correction to adjust for multiple continuous variables
- other things to consider: how many matches, which algorithm (eg Coarse, pre-processing), whether to drop treatment units to remove bias, calipers to remove units with no common support

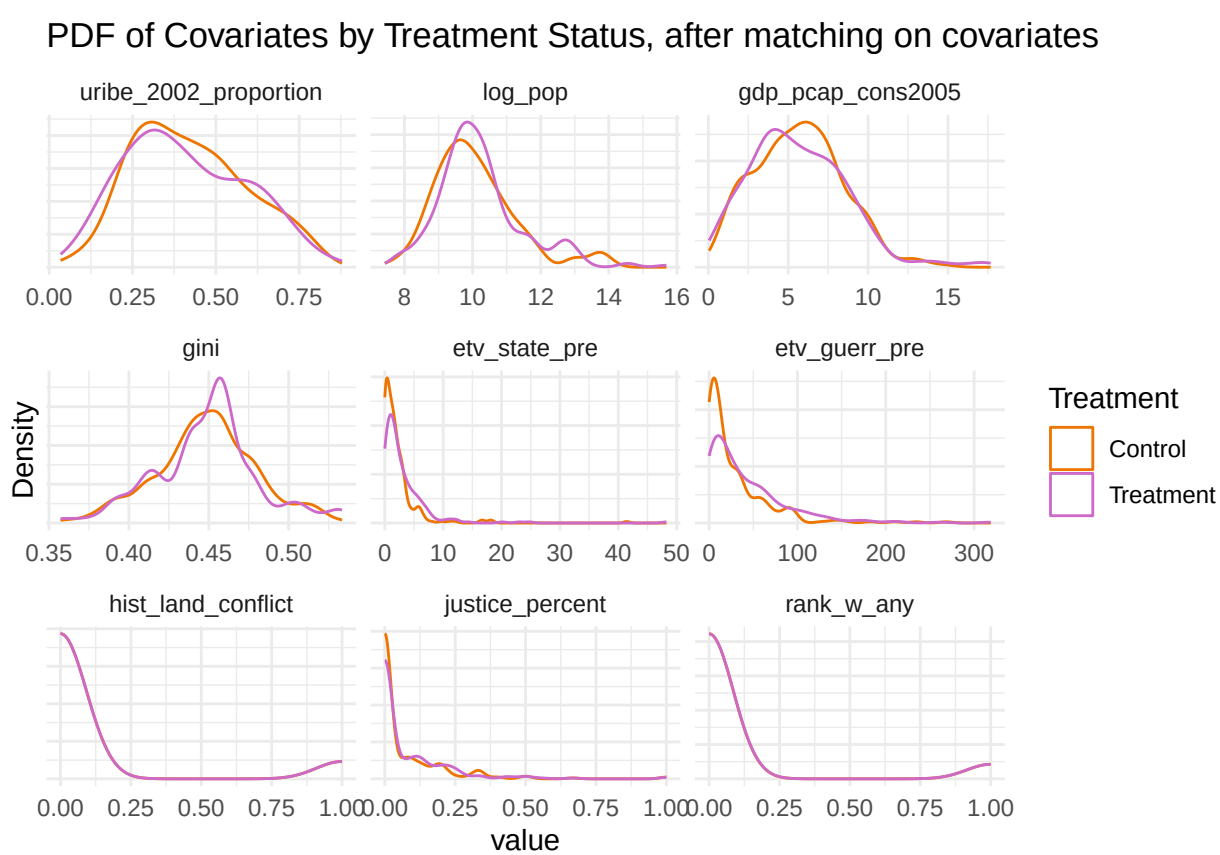
First, creating a matched dataset:

```
##
##   0   1
## 253 253
```

Should we run it multiple times? The results don't change much

Then, checking the balance after the matching

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.409	0.422	0.014	0.312
log_pop	10.204	10.075	0.000	0.168
gdp_pcap_cons2005	5.600	5.665	0.577	0.467
gini	0.449	0.449	0.513	0.467
etv_state_pre	3.073	2.150	0.000	0.002
etv_guerr_pre	41.481	28.304	0.000	0.000
hist_land_conflict	0.107	0.107	1.000	NA
justice_percent	0.075	0.068	0.070	0.484
rank_w_any	0.091	0.091	0.181	0.879



Finally, calculating ATT

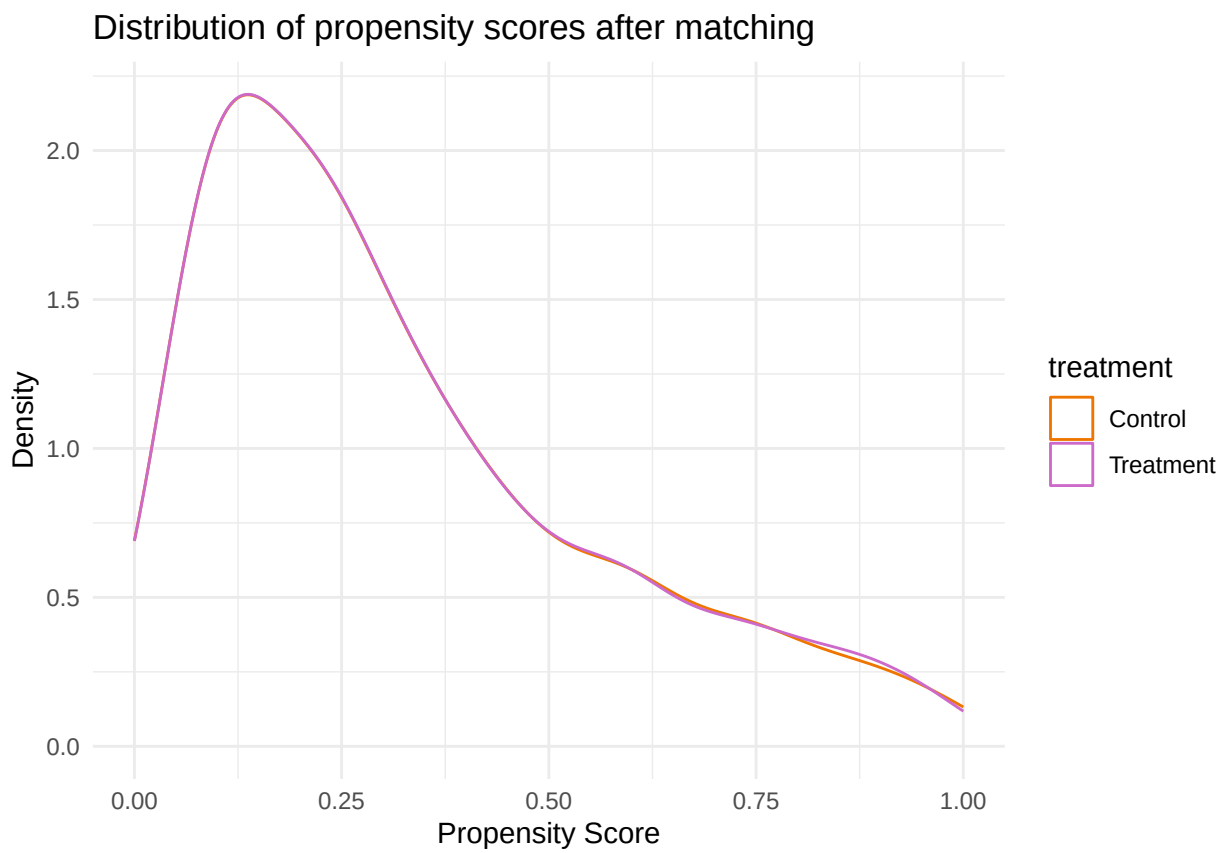
3.4 Matching - Propensity score matching

Compare units that have a comparable probability of getting treated to match:

```
##
##   0   1
## 453 453
```

Checking balance after matching:

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.408	0.392	0.349	0.050
log_pop	10.192	9.999	0.026	0.276
gdp_pcap_cons2005	5.601	5.328	0.313	0.080
gini	0.449	0.452	0.365	0.000
etv_state_pre	3.611	3.622	0.979	0.000
etv_guerr_pre	50.457	58.058	0.179	0.000
hist_land_conflict	0.108	0.080	0.252	NA
justice_percent	0.076	0.078	0.884	0.290
rank_w_any	0.089	0.146	0.038	0.114

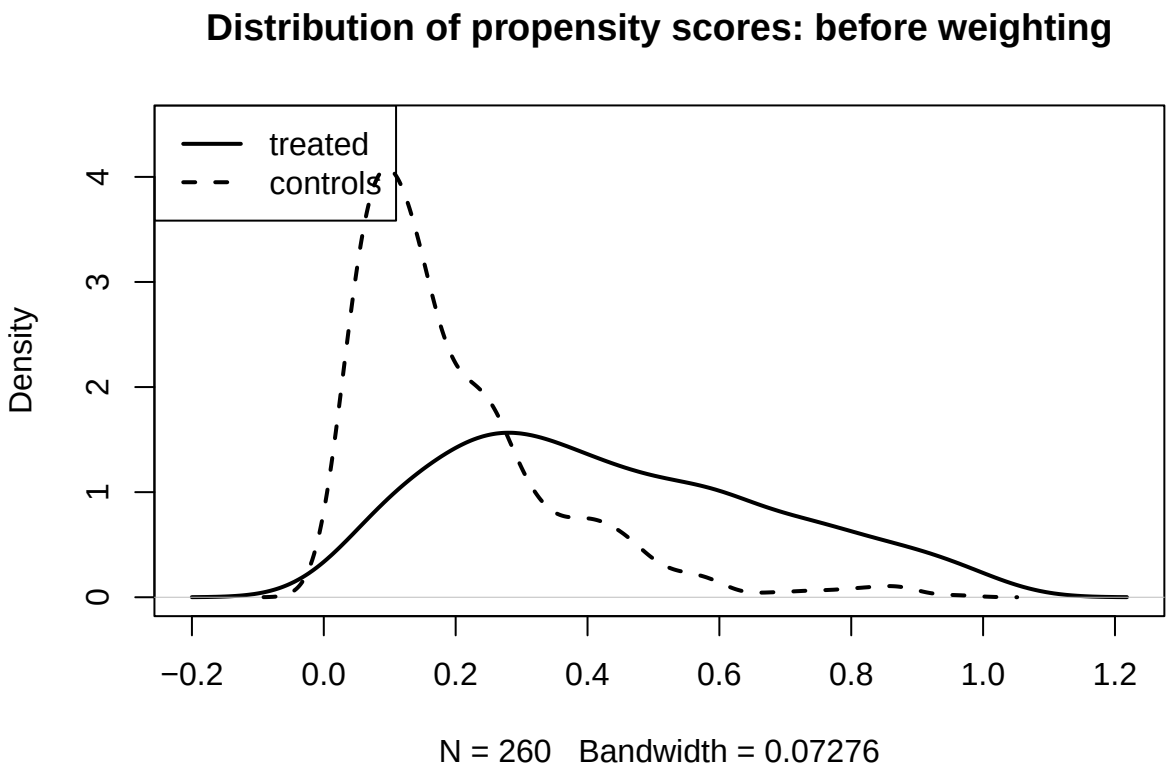


Calculating the ATT:

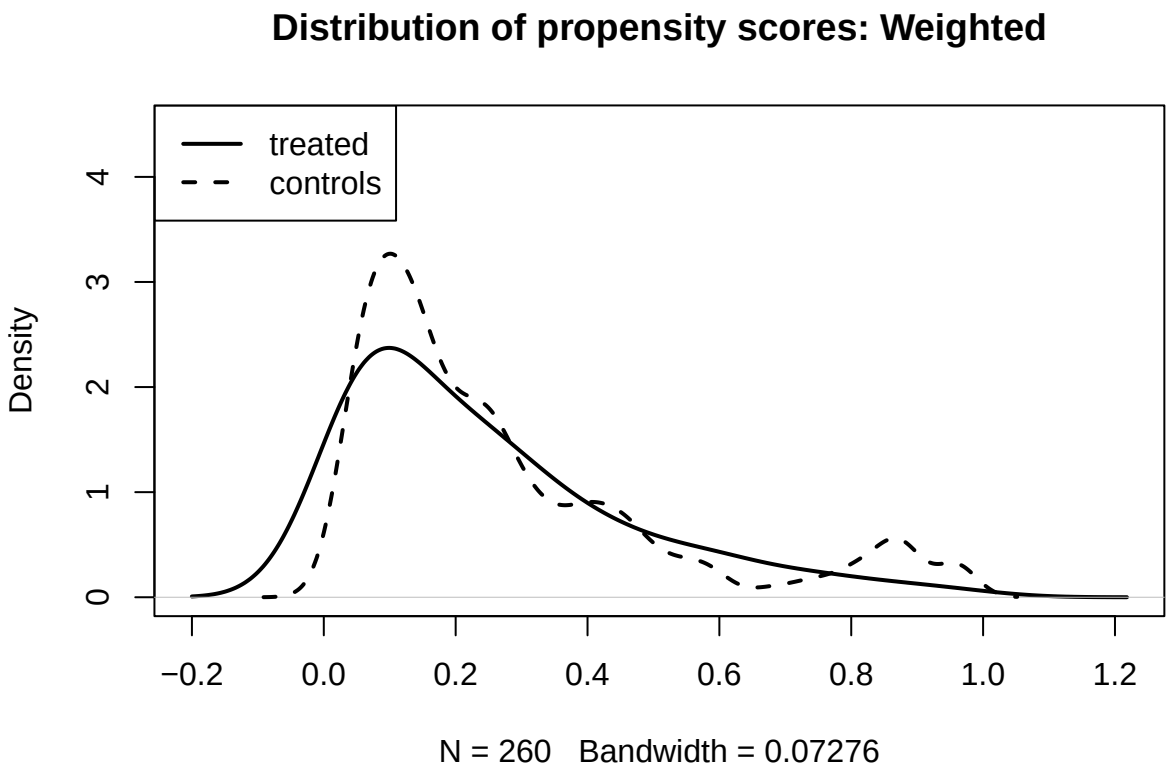
The Match() propensity scores afterwards are very close, but the data has been significantly manipulated: there are many duplicates of both control and treatment

3.5 Weighting - propensity scores

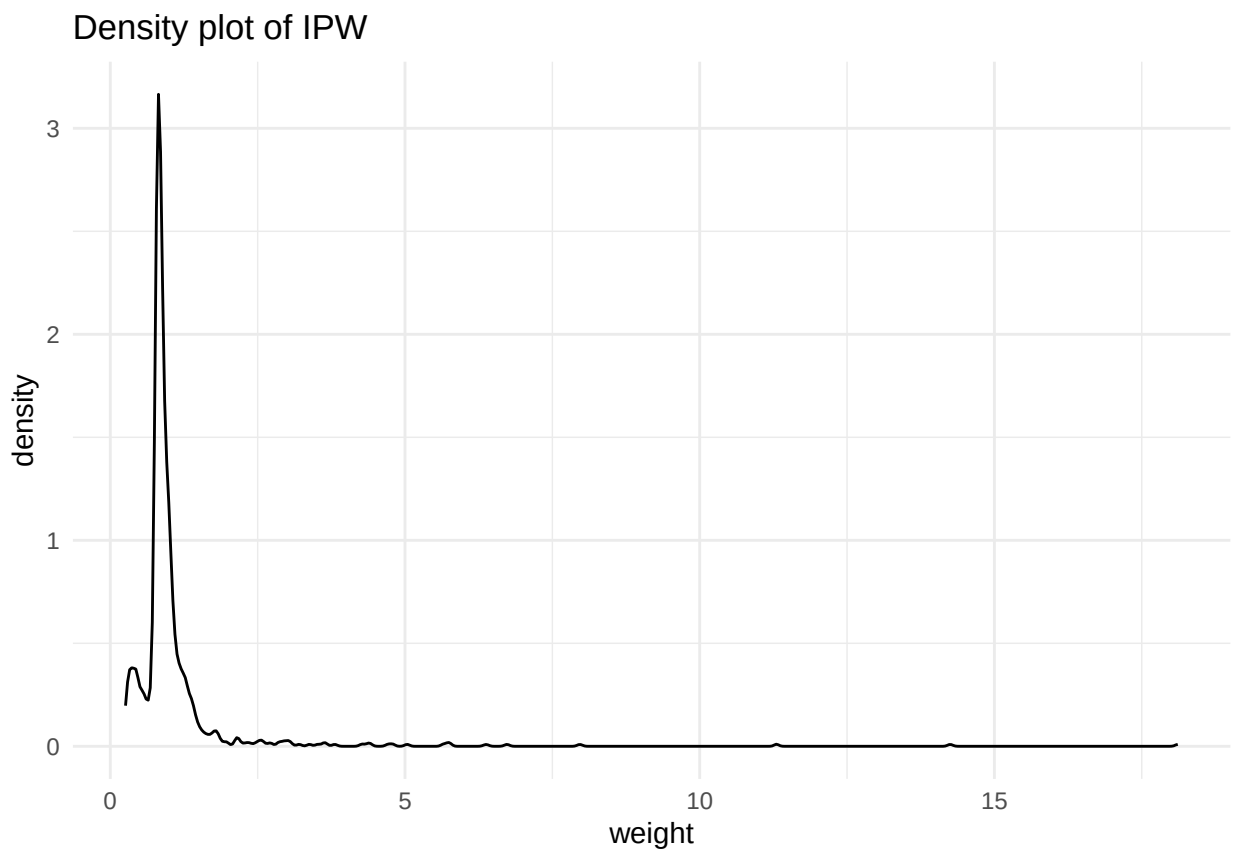
Inverse Probability-of-Treatment Weighting (IPW):



Distribution of propensity scores: before weighting
treated
controls
Density
0
1
2
3
4
−0.2
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 260 Bandwidth = 0.07276



Distribution of propensity scores: Weighted
treated
controls
Density
0
1
2
3
4
−0.2
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 260 Bandwidth = 0.07276

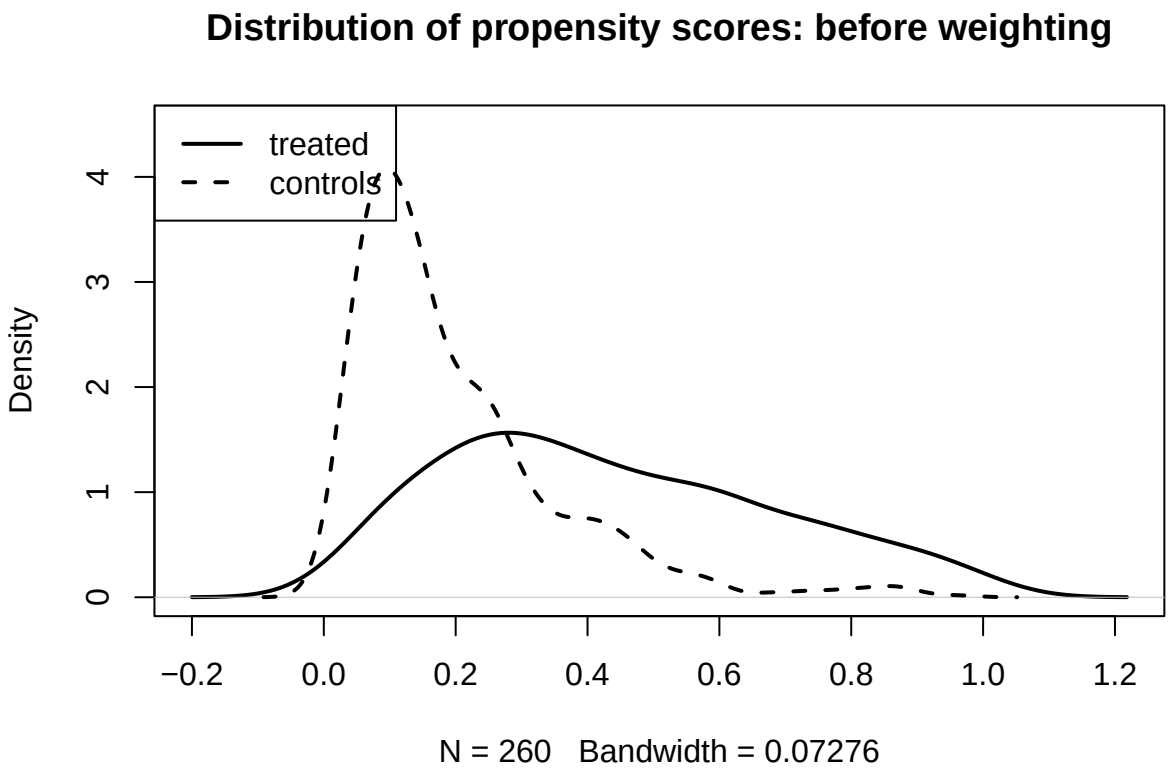


Check how extreme the weights get / how few units are doing most of the work - it means large bias

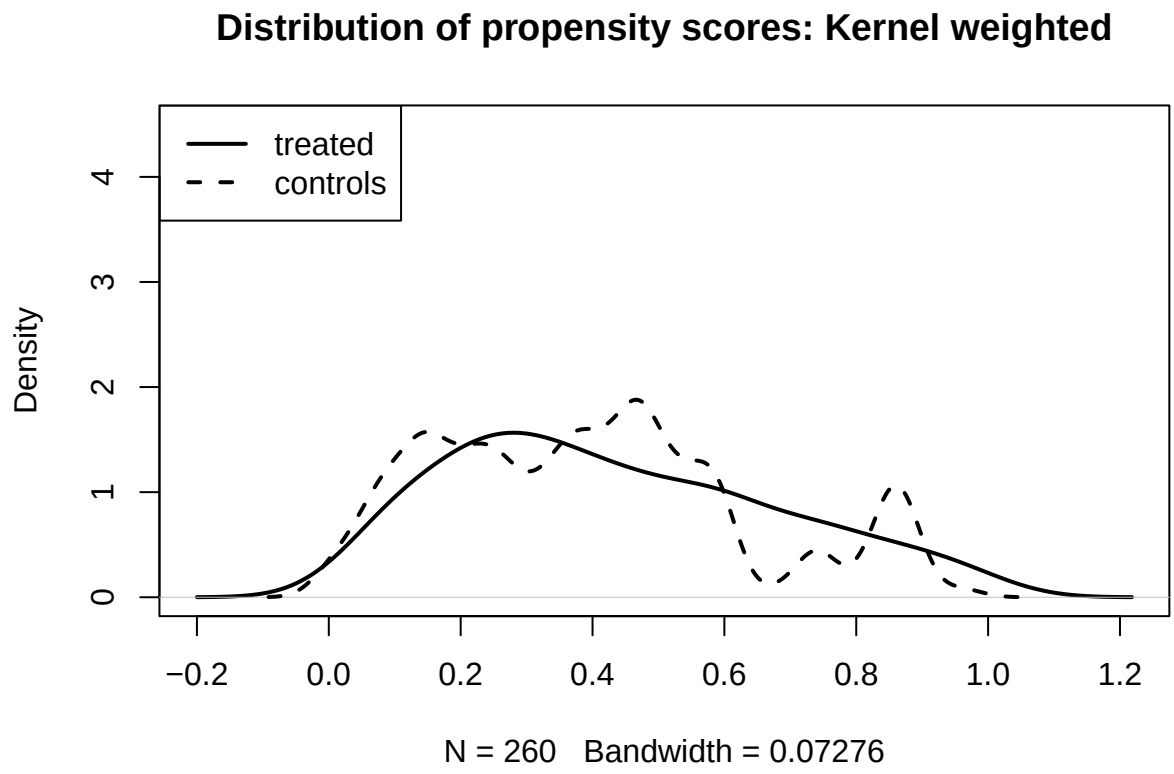
Take regressions:

3.6 Weighting - Kernel balancing weights

Propensity scores before and after kernel weighting



Distribution of propensity scores: before weighting
treated
controls
Density
0
1
2
3
4
−0.2
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 260 Bandwidth = 0.07276



Balance tables, before and after kernel weighting

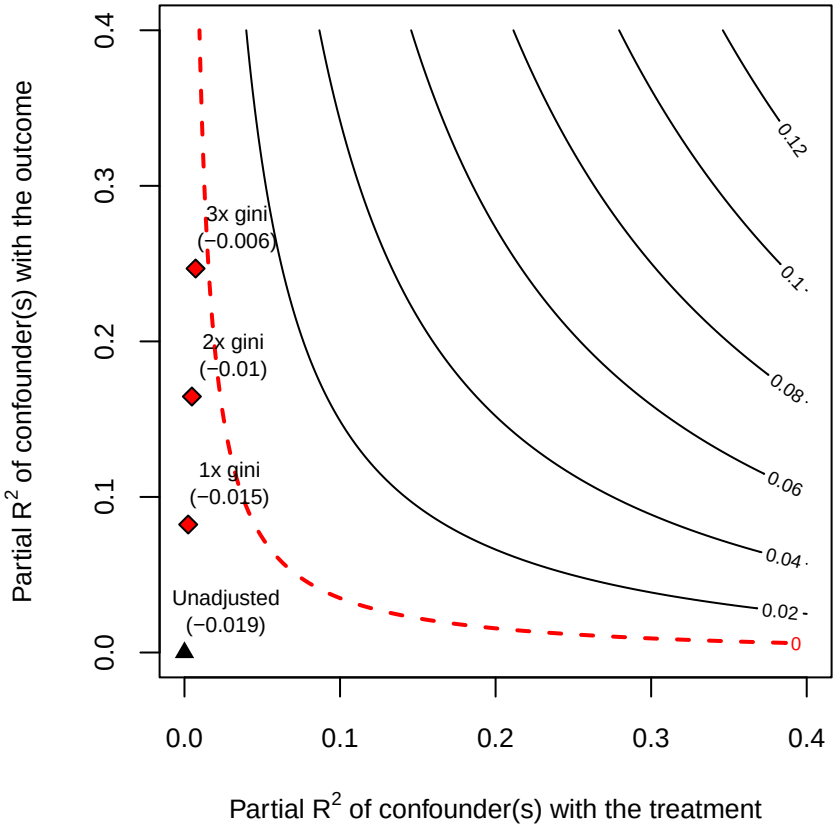
6. Sensitivity analysis

Which covariate as a benchmark?



Sensitivity with regular lm() only; ipw/matching weights mess it up – how to add other versions?
