MPSA 2026 - estimation results for paper

Sofía Granados and Linette Page

2026-04-19

1. Set up

2. Data cleaning

Treatment is disappearances and homicides by the state; calculated as the yearly rate by 10,000

2.1 choosing treatment and covariates

2.2 Covariates

A density plot of the yearly rate of cases per 10,000 per municipality; followed by the exact number and proportion of control municipalities

```
##    0
## 366
```

```
## [1] 0.3638171
```

2.2.1 Covariate balance

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.430	0.468	0.004	0.001
log_pop	9.899	8.998	0.000	0.000
gdp_pcap_cons2005	5.798	6.399	0.050	0.353
gini	0.449	0.468	0.000	0.000
etv_state_pre	3.142	0.937	0.000	0.000
etv_guerr_pre	37.680	15.411	0.000	0.000
hist_land_conflict	0.069	0.025	0.001	NA
justice_percent	0.076	0.069	0.528	0.000
rank_w_any	0.064	0.038	0.062	0.053

3 Versions of matching and weighting

3.1 Naive regression

3.2 Naive + Control regression

3.3 Matching - covariates

Throws away non-matched control units

- No replacement and one-to-one matching

- with Match(): closest X_i through normalized Euclidean distance
- BiasAdjust = TRUE: bias correction to adjust for multiple continuous variables
- other things to consider: how many matches, which algorithm (eg Coarse, pre-processing), whether to drop treatment units to remove bias, calipers to remove units with no common support

First, creating a matched dataset:

```
##
##   0   1
## 606 606
```

Should we run it multiple times? The results don't change much

Then, checking the balance after the matching

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.431	0.442	0.006	0.092
log_pop	9.867	9.591	0.000	0.000
gdp_pcap_cons2005	5.798	5.996	0.018	0.016
gini	0.449	0.453	0.000	0.001
etv_state_pre	2.588	1.354	0.000	0.000
etv_guerr_pre	30.552	17.228	0.000	0.000
hist_land_conflict	0.059	0.059	1.000	NA
justice_percent	0.070	0.059	0.000	0.000
rank_w_any	0.060	0.059	0.101	0.834

Finally, calculating ATT

3.4 Matching - Propensity score matching

Compare units that have a comparable probability of getting treated to match:

```
##
##   0   1
## 711 711
```

Checking balance after matching:

	Treatment Mean	Control Mean	T p-value	KS p-value
uribe_2002_proportion	0.430	0.512	0.000	0.000
log_pop	9.899	9.532	0.000	0.000
gdp_pcap_cons2005	5.798	6.469	0.000	0.000
gini	0.449	0.454	0.006	0.000
etv_state_pre	3.142	5.248	0.000	0.000
etv_guerr_pre	37.680	32.823	0.044	0.000
hist_land_conflict	0.069	0.034	0.006	NA
justice_percent	0.076	0.051	0.002	0.000
rank_w_any	0.064	0.058	0.643	0.672

Calculating the ATT:

The Match() propensity scores afterwards are very close, but the data has been significantly manipulated: there are many duplicates of both control and treatment

3.5 Weighting - propensity scores

Inverse Probability-of-Treatment Weighting (IPW):

Distribution of propensity scores: before weighting
treated
controls
Density
0
1
2
3
4
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 640 Bandwidth = 0.05585

Distribution of propensity scores: Weighted
treated
controls
Density
0
1
2
3
4
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 640 Bandwidth = 0.05585

Check how extreme the weights get / how few units are doing most of the work - it means large bias

Take regressions:

3.6 Weighting - Kernel balancing weights

Propensity scores before and after kernel weighting

Distribution of propensity scores: before weighting
treated
controls
Density
0
1
2
3
4
0.0
0.2
0.4
0.6
0.8
1.0
1.2
N = 640 Bandwidth = 0.05585

Balance tables, before and after kernel weighting

6. Sensitivity analysis

Which covariate as a benchmark?

Sensitivity with regular lm() only; ipw/matching weights mess it up – how to add other versions?
